ERRORS

22 ⁰**15 pages have duplicate meta descriptions**

About this issue: Our crawler reports pages that have duplicate meta descriptions only if they are exact matches. A <meta description> tag is a short summary of a webpage's content that helps search engines understand what the page is about and can be shown to users in search results. Duplicate meta descriptions on different pages mean a lost opportunity to use more relevant keywords. Also, duplicate meta descriptions make it difficult for search engines and users to differentiate between different webpages. It is better to have no meta description at all than to have a duplicate one. How to fix: Provide a unique, relevant meta description for each of your webpages. For information on how to create effective meta descriptions, please see this Google article: <https://support.google.com/webmasters/answer/35624>

15 ⁰**4 issues with duplicate title tags**

About this issue: Our crawler reports pages that have duplicate title tags only if they are exact matches. Duplicate <title> tags make it difficult for search engines to determine which of a website's pages is relevant for a specific search query, and which one should be prioritized in search results. Pages with duplicate titles have a lower chance of ranking well and are at risk of being banned. Moreover, identical <title> tags confuse users as to which webpage they should follow. How to fix: Provide a unique and concise title for each of your pages that contains your most important keywords. For information on how to create effective titles, please see this Google article: <https://support.google.com/webmasters/answer/35624>

4 ⁰**1 page returned a 4XX status code**

About this issue: A 4xx error means that a webpage cannot be accessed. This is usually the result of broken links. These errors prevent users and search engine robots from accessing your webpages, and can negatively affect both user experience and search engine crawlability. This will in turn lead to a drop in traffic driven to your website. Please be aware that crawler may detect a working link as broken if your website blocks our crawler from accessing it. This usually happens due to the following reasons: 1. DDoS protection system. 2. Overloaded or misconfigured server. How to fix: If a webpage returns an error, remove all links leading to the error page or replace it with another resource. To identify all pages on your website that contain links to a 4xx page, click "View broken links" next to the error page. If the links reported as 4xx do work when accessed with a browser, you can try either of the following: 1. Contact your web hosting support team. 2. Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt

1 ⁰**1 internal link is broken**

About this issue: Broken external links lead users from one website to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded. Please note that our crawler may detect a working link as broken. Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website. How to fix: Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource. If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.

1 ⁰

1 incorrect page found in sitemap.xml

1

About this issue: A sitemap.xml file makes it easier for crawlers to discover the pages on your website. Only good pages intended for your visitors should be included in your sitemap.xml file. This error is triggered if your sitemap.xml contains URLs that: 1. lead to webpages with the same content. 2. redirect to a different webpage. 3. return non-200 status code. Populating your file with such URLs will confuse search engines, cause unnecessary crawling or may even result in your sitemap being rejected. How to fix: Review your sitemap.xml for any redirected, non-canonical or non-200 URLs. Provide the final destination URLs that are canonical and return a 200 status code.

0 pages returned 5XX status code

0

0 pages don't have title tags

0

0 pages have duplicate content issues

0

0 pages couldn't be crawled

0

WARNINGS

31 ⁰**14 pages have low text-HTML ratio**14 ⁰

About this issue: Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content. That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster. How to fix: Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.

9 pages don't have an h1 heading9 ⁰

About this issue: While less important than <title> tags, h1 headings still help define your page's topic for search engines and users. If an <h1> tag is empty or missing, search engines may place your page lower than they would otherwise. Besides, a lack of an <h1> tag breaks your page's heading hierarchy, which is not SEO friendly. How to fix: Provide a concise, relevant h1 heading for each of your page.

5 pages have a low word count5 ⁰

About this issue: This issue is triggered if the number of words on your webpage is less than 200. The amount of text placed on your webpage is a quality signal to search engines. Search engines prefer to provide as much information to users as possible, so pages with longer content tend to be placed higher in search results, as opposed to those with lower word counts. For more information, please view this video: <https://www.youtube.com/watch?v=w3-obcXkyA4>. How to fix: Improve your on-page content and be sure to include more than 200 meaningful words.

2 pages have temporary redirects2 ⁰

About this issue: Temporary redirects (i.e., a 302, 303 and a 307 redirect) mean that a page has been temporarily moved to a new location. Search engines will continue to index the redirected page, and no link juice or traffic is passed to the new page, which is why temporary redirects can damage your search rankings if used by mistake. How to fix: Review all pages to make sure the use of 302, 303 and 307 redirects is justified. If so, don't forget to remove them when they are no longer needed. However, if you permanently move any page, replace a 302/303/307 redirect with a 301 one.

1 external link is broken1 ⁰

About this issue: Broken external links lead users from one website to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded. Please note that our crawler may detect a working link as broken. Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website. How to fix: Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource. If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.

0 external images are broken	0 <input type="radio"/>
0 links on HTTPS pages leads to HTTP page	0 <input type="radio"/>

NOTICES

3 0

2 pages are blocked from crawling

About this issue: If a page cannot be accessed by search engines, it will never appear in search results. A page can be blocked from crawling either by a robots.txt file or a noindex meta tag. How to fix: Make sure that pages with valuable content are not blocked from crawling by mistake.

2 0

1 page has only one incoming internal link

About this issue: Having very few incoming internal links means very few visits, or even none, and fewer chances of placing in search results. It is a good practice to add more incoming internal links to pages with useful content. That way, you can rest assured that users and search engines will never miss them. How to fix: Add more incoming internal links to pages with important content.

1 0

0 pages have more than one H1 tag

0 0

URLs on 0 pages are too long

0 0

0 outgoing external links contain nofollow attributes

0 0

Robots.txt not found

0 0

0 pages have hreflang language mismatch issues

0 0

0 subdomains don't support HSTS

0 0

0 orphaned pages in Google Analytics

0 0

0 orphaned pages in sitemaps

0 0

0 pages take more than 1 second to become interactive

0 0

0 pages blocked by X-Robots-Tag: noindex HTTP header

0 0

0 issues with blocked external resources in robots.txt

0 0

0 issues with broken external JavaScript and CSS files

0

0 pages need more than 3 clicks to be reached

0

Broken external links

i *About this issue: Broken external links lead users from one website to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded. Please note that our crawler may detect a working link as broken. Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website. How to fix: Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource. If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.*

Blocked from crawling

i *About this issue: If a page cannot be accessed by search engines, it will never appear in search results. A page can be blocked from crawling either by a robots.txt file or a noindex meta tag. How to fix: Make sure that pages with valuable content are not blocked from crawling by mistake.*

Pages with only one internal link

i *About this issue: Having very few incoming internal links means very few visits, or even none, and fewer chances of placing in search results. It is a good practice to add more incoming internal links to pages with useful content. That way, you can rest assured that users and search engines will never miss them. How to fix: Add more incoming internal links to pages with important content.*
